Time change scripts changes

Introduction

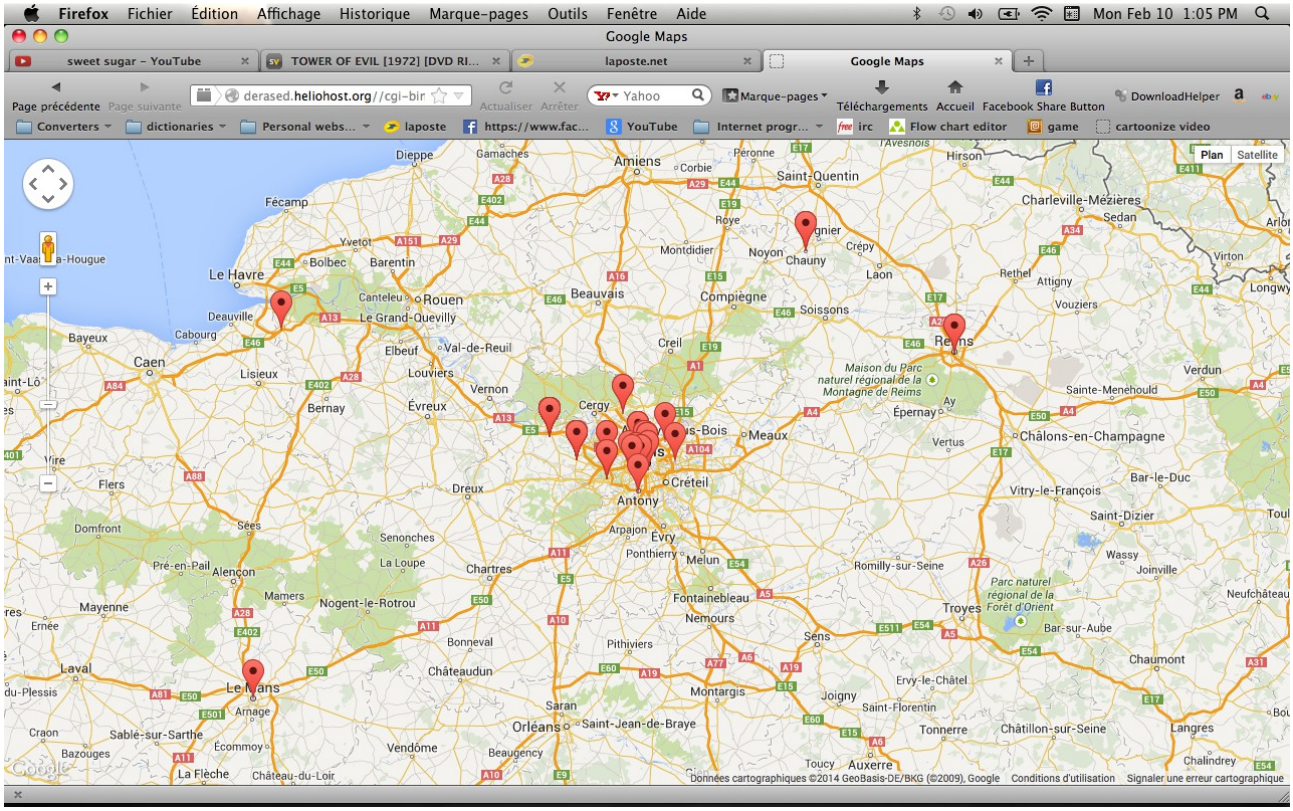
The latest version that printed paths, or markers on the map was g2ogle.cgi. It used the google map scripts V2. Now V3 is used on the net. It is necessary to enhance the code because the scripting is more powerfull.

The g2ogle.cgi version

It could print the place where a person visited the album. Trace a route when they were on a trip.
From the album could save the google id that allowed the printing.
Now it is possible to give a name to the trip.
If the version of the google map is specified can go directly to the google map version of the script appropriate.

The g3ogle.cgi version

All the features introduced in the g2ogle.cgi will be in the next version.
The map will be wider on the script (see below).



The map

Bugs will be solved and arrows drawn to indicate the side of the

path.
