

The architecture (20101118)

#### History

We have html pages. The heck is that it was not possible to calculate latest page modified in a given directory.

#### How to

To do that we had to make php scripts to search the latest file that was modified in a current directory. Then calculus can be done with subdirectories too of that directory if subs exists.

#### The first steps

To get last file modification from a directory or subdirectory we need to use recursive algorithm.

#### How about version number of cgi algorithm?

To do that we have to modify cgi script to give version number once requested by php script.

#### How about Encryption

Encryption is done with one algorithm: the Jangada algorithm. To do that tests were done with version of the album. Tests are done too with the history of modification of the album. First was successful but the second not for the time being.
